FOREWORD

In an ongoing effort, the Defense Logistics Agency (DLA) Operations Research and Economic Analysis Management Support Office, DLA-DORO, has developed and fielded versions of the Quality Effectiveness Sensing Technique (QUEST) Model for the Quality Assurance (QA) mission with Contract Administration Services. This report documents the logic, structure and code for QUEST release 3.0.

QUEST release 3.0 measures the effectiveness of the contractor's QA operations by comparing the contractor's key indicators with those of similar contractors (or peers). Based on those peer comparisons and trends, an effectiveness score for each indicator is computed and a weighted average of all indicators produces a bottom line effectiveness rating.

Release 3.0 was validated by incorporating the profound knowledge of experts in the weighting factors and program logic. A Study Advisory Group, consisting of field and Headquarters QA personnel guided the effort. A statistical test was passed which compared QUEST release 3.0 results with expert opinion on certain contractors.

Because of the track record of earlier releases, the use of knowledgeable experts in the development process and the results of validity tests, it is concluded that QUEST 3.0 is implementable, valid and meets the objective of measuring contractor QA effectiveness. It is recommended that release 3.0 be implemented throughout the Defense Contract Management Command (DCMC).

EXECUTIVE SUMMARY

In an ongoing effort, the Defense Logistics Agency (DLA) Operations Research and Economic Analysis Management Support Office, DLA-DORO, has developed and fielded versions of the Quality Effectiveness Sensing Technique (QUEST) Model for the Quality Assurance (QA) mission with Contract Administration Services. This report documents the logic, structure and code for QUEST release 3.0.

The major differences between release 3.0 and earlier versions are as follows. First, release 3.0 focuses exclusively on contractor QA effectiveness and has no measures for in-house program effectiveness. Secondly, this version is based on the new In-Plant Quality Evaluation Program rather than its predecessor, Contract Quality Assurance Program. Finally, the indicators used by release 3.0 are those currently available in the revised Quality Assurance Management Information System.

QUEST 3.0 computes measures of effectiveness using an analytical technique called Technique for Order Preference by Similarity to Ideal Solution (TOPSIS). TOPSIS was used in earlier releases to compute a "Product" Score, evaluating the potential for nonconforming product. TOPSIS produces percentage scores on a scale of 0-100 percent for seven key indicators by comparing a contractor's QA data with that of similar contractors and also by computing trends. Based on this peer comparison and evidence of improvement (or lack thereof), the contractor is measured and reports are generated to QA supervisors and managers.

Release 3.0 was validated by incorporating the profound knowledge of experts in the weighting factors and program logic. A Study Advisory Group, consisting of field and Headquarters QA personnel guided the effort. A statistical test was passed which compared QUEST release 3.0 results with expert opinion on certain contractors.

Because of the track record of earlier releases, the use of knowledgeable experts in the development process and the validation test results, it is concluded that QUEST 3.0 is implementable, valid and meets the objective of measuring contractor QA effectiveness. It is recommended that release 3.0 be implemented throughout the Defense Contract Management Command (DCMC).

I. INTRODUCTION

A. Background. Quality Assurance Effectiveness Sensing Technique (QUEST) was developed to provide supervisors and upper management a tool to measure and monitor the effectiveness of in-plant quality operations at Defense Contract Administration Services (DCAS). Developed in the Fiscal Year (FY) 1987 - 1988 timeframe, QUEST was implemented in FY 89. An improved version of QUEST, release 2.0, was implemented in March 1990. These versions of QUEST were based on DLAM 8200.1, Contract Quality Assurance Program or CQAP. In FY 90, a transition from CQAP to a new program began within DCAS. As the new program, called In-Plant Quality Evaluation (IQUE), phased in, QUEST 2.0 has become obsolete, requiring a new version of the model.

B. Problem Statement

1. To develop a plan to modify QUEST 2.0 to be compatible with the new policies and procedures under IQUE.
2. To establish necessary data requirements to support a new release of QUEST.
3. To develop a new release of QUEST to satisfy Defense Logistics Agency (DLA) commitments to the Department of Defense (DoD) to establish measures of effectiveness for Quality Assurance (QA).

C. Objectives

1. To develop a workable, valid model that measures QA effectiveness under IQUE.
2. To influence the functional description of the QA Management Information System (QAMIS) to assure necessary data is available to measure effectiveness.

D. Scope. QUEST 3.0 will apply to all active contractors under the surveillance of the Defense Contract Management Command (DCMC, formerly DCAS). QUEST release 3.0 will be limited to providing measures of contractor QA effectiveness only. Measures relating to the effectiveness of the government QA program will be addressed in this report but deferred for future decisions.

II. METHODOLOGY

A. General Discussion

QUEST 2.0 contained two primary effectiveness measures, namely a program score and a product score. Program scores were designed to measure the effectiveness of CQAP operations and were a report card on the government surveillance system. Product scores were designed to measure product conformance to requirements and were a report card on the contractor.

Under the IQUE philosophy, the Government and the contractor work more as a team, less as adversaries. As such, it is increasingly difficult to measure each independently. The goal of IQUE is to place less emphasis on inspecting final product and to increased emphasis on controlling production processes. Since each contractor has a unique set of processes, IQUE is very flexible and tailored to the contractor by the government Quality Assurance Representative (QAR). The regimented, standardized approach of CQAP lent itself more to measurement. IQUE will be more difficult to measure from a program perspective.

These issues were discussed by the QUEST 3.0 Study Advisory Group (SAG) (Appendix A). Because of time constraints and the perceived difficulty of developing program measures for IQUE, it was decided that release 3.0 should be limited to measuring contractor effectiveness. If the IQUE program is successful and hence effective, the results will be evident from contractor effectiveness scores. Continuous improvement of contractor effectiveness measures is a signal of the effectiveness of IQUE. The SAG felt that measures of IQUE program effectiveness should not be terminated, only given lower priority than contractor effectiveness. The group recommended that program effectiveness be considered as an add-on at a later date, if feasible.

B. Contractor Effectiveness. Like earlier versions of QUEST, release 3.0 is based on the premise that available data only signals instances of ineffectiveness. Thus indicators are called negative indicators. The more negative indicators associated with a particular contractor, the less effective that contractor is perceived to be. QUEST 3.0 will capture data on negative indicators of effectiveness and translate that data to measures of effectiveness. The indicators, currently available in the QAMIS, used by QUEST 3.0 are:

1. Corrective Action Requests (CAR). Verbal, written and escalation CARs (methods C, D, and E) are weighted and added to produce an indicator value for CARs. Relative to a method C CAR, the sum of verbal and written CARs are weighted 4 to 1 (4 verbal or written CARs count the same as a method C). Two method C CARs have equal weight to a method D and a method E has equal weight to method C. Weighting factors were determined by the SAG.

2. Product Quality Deficiency Reports (PQDR). PQDR indicators are used exactly the same way that earlier versions of QUEST evaluated Materiel Deficiency Reports, with two exceptions. PQDRs charged against an Indefinite Delivery Type Contract or Basic Ordering Agreement (Procurement Instrument Identification Number Type "D" or "G" contracts) are not discounted for age and carry full weight. Also PQDRs with defect code "X," contractor refuses to investigate, are counted as valid PQDRs. For additional information on PQDR processing, see Appendix C within Reference 1.

3. Product Audit. The ratio of product audit counts that resulted in CARs to total product audit counts is converted to a percentage value. This indicator represents the percentage of product audits that contain contractual nonconformances.

4. Waivers. The number of waivers submitted to the QAR and reported in the QAMIS is the fourth indicator. Waivers are after the fact requests to the Contracting Officer to modify or eliminate contractual requirements.

5. Material Review Board (MRB) Actions. The number of MRB actions reported by the QAR is an indicator that has not been modified from earlier versions of QUEST. MRB actions are minor nonconformances reported by the contractor.

6. Deviations. The number of deviations submitted to the QAR and reported monthly in the QAMIS is the sixth indicator. Earlier versions of QAMIS reported combined waivers and deviations. With the new QAMIS, these data elements are reported separately and are used separately in QUEST 3.0. Deviations are before-the-fact requests to deviate from contractual requirements (i.e. after the contract is awarded but before actual production of the item).

7. Engineering Change Proposals (ECP). ECPs submitted to the QAR are the last indicator used to evaluate contractor effectiveness. This indicator remains unchanged from earlier versions of QUEST. ECPs are formal requests by the contractor to permanently change the specifications.

8. Total Score. A composite total score is generated in QUEST by taking a weighted average of the preceding seven indicators, listed in the order of decreasing weight. Weights were generated by the SAG, reflecting the relative importance of each indicator in viewing contractor quality performance. Details are shown in Appendix B, page B-33.

9. Indicator Measurement

Translation from raw indicator data to a consistent measure of effectiveness is done using the Technique for Order Preference by Similarity to Ideal Solution (TOPSIS), developed by Dr. Ching-Lai Hwang of Kansas State University [2, 3]. TOPSIS is used to produce scores on a scale of 0-100 percent from multiple criteria by measuring each criteria from a set of "ideal" and "negative ideal" points. "Ideal" conditions are defined as the best possible values for each criteria or attribute. "Negative ideal" conditions are the worst possible values for each parameter or indicator. Ideal and negative ideal conditions were defined by the SAG. Definitions for ideal/negative ideal vary depending on whether the contractor is considered to be "normal" or a "problem" contractor.

A "problem" contractor is considered to be a contractor that has a history of chronic performance problems. QUEST assigns additional emphasis to the trend component of the measurement process for these contractors. To be viewed by QUEST 3.0 as a problem contractor, two of the following conditions must apply. First, the contractor is on the Contractor Alert List (for any reason). The Alert List is compiled by DCMC to warn acquisition elements of contract administration problems experienced.

Second, the contractor has a history of relatively high incidence of valid PQDRs. Third, the contractor received a method C CAR within the last three months. Fourth, the contractor received a method D Corrective Action Request within the last year. Finally, the contractor received a method E CAR within the last three months.

The Trend component in the measure of effectiveness carries half the weight in overall indicator measurement for a normal contractor and 10 percent of the weight for a problem contractor. Trend is calculated based on the last six months of activity. Activity is defined as any month when more than two hours of total government QA surveillance takes place. If the slope of the trend line is upward or positive, QUEST views this as unfavorable and penalizes the contractor. Downward or negative trends result in high effectiveness scores.

The second part of the measurement process is to measure the contractor's data in relation to the contractor's "peers." If the contractor's indicators are higher than those of "peers," QUEST produces low effectiveness scores. Lower-than-peers indicators result in high effectiveness scores. Additional information on the Peer Processing is in Appendix F of Reference 4. In all cases, except PQDR for problem contractors, ideal conditions are minus three standard deviations for trend and peer comparison. Negative ideal conditions are plus three standard deviations. A +3 standard deviation means that the trend or peer comparison is three standard deviations above average. A -3 standard deviation indicates that the contractor's trend or peer comparison is three standard deviations below average. Details are found in Appendix B, page B-33.

TOPSIS mathematically converts trend and peer comparison results into a single measure by computing two distances. A given contractor's trend is compared to ideal and negative ideal trend. Also, the indicator value relative to peers for the contractor is compared to the ideal and negative ideal conditions. The difference between the contractor's actual trend and peer comparison to ideal points is called a distance. TOPSIS combines the distances into a ratio of a part to a whole, forming a score between 0 percent and 100 percent. Specifically, TOPSIS scores are the ratio of distance from negative ideal to the total distance from both positive and negative ideal. The resulting scores are such that low scores indicate proximity to negative ideal (poor effectiveness) and high ratios indicate closeness to ideal conditions (high effectiveness).

10. Reports

QUEST 3.0, like QUEST 2.0, provides data to users in three ways. A district level report is generated to a printer. This report contains a one page summary for each unique organization (section) in the district each month. An example is shown in Table 1. Secondly, through the Mechanization of Reports Distribution System (MORDS), each division receives the same hard copy report for the organizations within the division. For users that have terminals and access to the district's DMINS system, QUEST data is electronically available in a menu-driven format.

COMBINED													

The QUEST 3.0 report is similar to previous QUEST reports [1, 4]. Generally, for QUEST 3.0, sections dealing with Program Score (Red Flags) have been eliminated, and additional descriptive data on the contractor is provided. Also, historical QUEST scores are shown to ease trend analysis. The following Table 1 headings are defined.

- a. CAGE. Commercial and Government Entity Code identifies the contractor. If there is an asterisk preceding the CAGE, the contractor has been labeled by QUEST as a "problem" contractor.
- b. NAME. First ten characters in the name field of the contractor.
- c. QAR. Identifies the government Quality Assurance Representative in charge of the government quality surveillance.
- d. COMM. Commodity Code in accordance with DLAM 8200.2.
- e. PVN. QA Provision Code. A represents MIL-Q-9858A or equivalent, B represents MIL-I-45208A and C is "other."
- f. QAS. The number of government QA Specialists (QAS) assigned to the facility. This number is computed from the total government QA hours charged to the contractor (roughly one man month equals 149 hours) and may not be the actual number of QASs assigned to the contractor.
- g. CA. Correction Action Request score.
- h. PQDR. Product Quality Deficiency Report score.
- i. PA. Product Audit Score.
- j. WVRS. Waiver Score.
- k. MRB. Materiel Review Board score.
- l. DEVN. Deviation Score.
- m. ECP. Engineering Change Proposal Score.
- n. TOTAL SCORE. Weighted average of the previous seven indicator scores. This represents the overall effectiveness score for the contractor.
- o. PRIOR MONTH. QUEST 3.0 shows up to three prior month TOTAL SCORES for each contractor.
- p. PEER GRP. Peer group identification number (see Appendix F of Reference 4). Contractors that have the same peer group number generally have the same commodity, provision and have roughly the same defense contract workload.

q. PEER RTG. Converts the Total Score to a letter grade. Since not all peer groups have the same pattern of QUEST scores (nonresidents generally get higher ratings than resident facilities), the letter grade represents a "relative to peer" effectiveness rating. For example, an identical Total Score of 80 percent could translate into a B, C or D rating, depending on the peer performance.

III. ANALYSIS

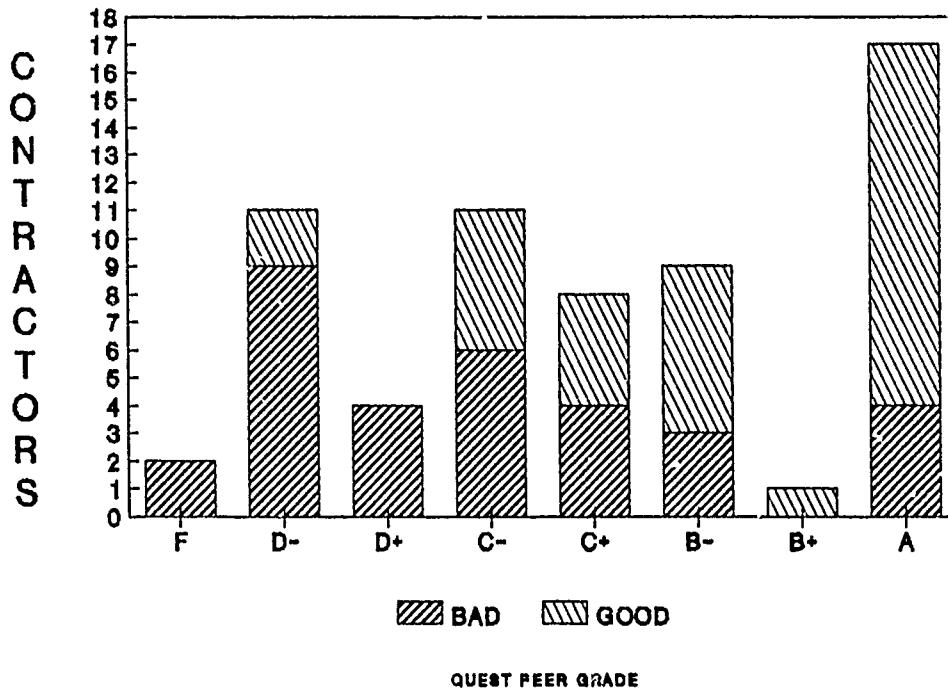

Prior to implementation, it was determined that because of the significant changes to QUEST, a revalidation was necessary. The original QUEST version was validated using a correlation technique matching QUEST scores to expert evaluations [1]. Because of the compressed schedule for QUEST 3.0, a similar but simpler nonparametric analytical process was used to determine if the QUEST scores reasonably matched the perception of experts. If the QUEST effectiveness rating correlated with expert opinion to an adequate degree, the model was considered valid by the SAG.

A Mann-Whitney rank sum test [5] was conducted. Mann-Whitney tests to determine if an effect could be caused by random coincidence or if an effect is "real." In statistical jargon, a "real" effect is called "statistically significant." We tested to see if the agreement between experts and QUEST is statistically significant. Each former DCAS region was asked to produce a set of contractors labeled as effective or ineffective from a QA viewpoint. These "good" or "bad" contractors were evaluated by QUEST for the September 1989 through December 1989 timeframe and four month average QUEST scores were computed. Also, the peer rating (A through F) was averaged to compute the equivalent of a Grade Point Average on a scale of 0.0 to 4.0 (4.0 equals straight A ratings for four consecutive months). The hypothesis that QUEST 3.0 was unable to distinguish, overall, between effective and ineffective contractors was overwhelmingly rejected. The level of significance for nonresident contractors was less than .0001 and for resident contractors the level of significance was .0039. In other words the probability of observing the degree of agreement between QUEST and the expert purely by chance is less than .0001 and .0039 respectively. QUEST 3.0 better matched expert opinion with the peer rating than the Total Scores. It appeared that the letter grades are more accurate in assessing performance than the numerical ratings. Figures 1 and 2 graphically summarize the test results. For example, Figure 1 shows that contractors identified as poor performers most frequently received a "D-" QUEST rating and good performers most frequently were rated as "A."

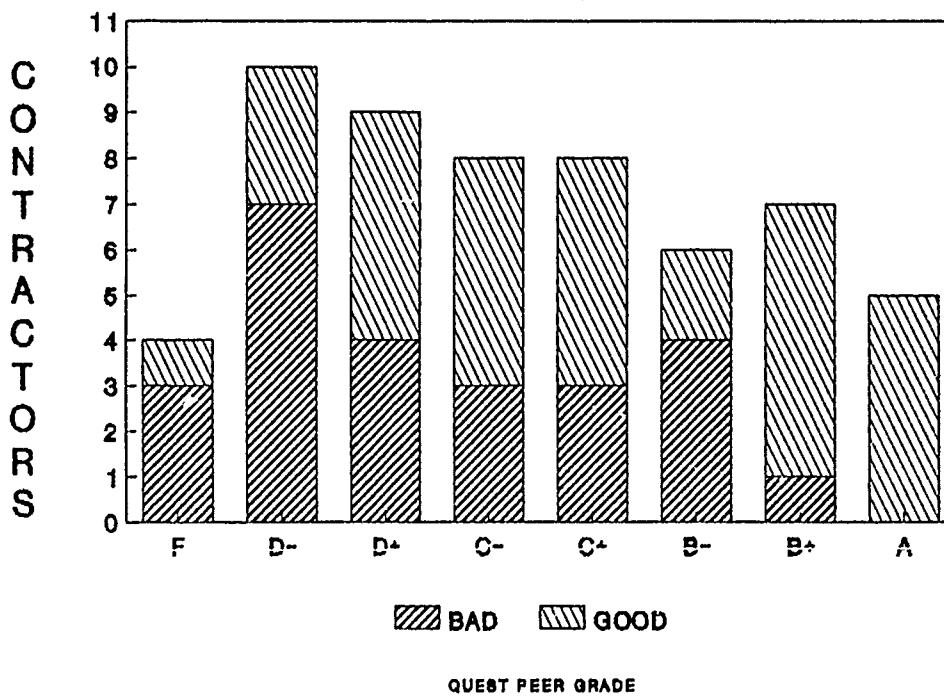

In an isolated number of cases, there is a disconnect between the QUEST rating and the expert's perception. A perceived "bad" contractor may have received an excellent QUEST rating and a perceived "good" contractor may be viewed unfavorably by QUEST. However, in most cases, the two evaluations agreed, causing sufficient correlation to pass statistical tests. Based on this test, prior experience with QUEST 2.0 and knowledge of the changes under QUEST 3.0, the SAG concluded that QUEST 3.0 was valid.

COMPARISON OF QUEST TO EXPERT
RESIDENT CONTRACTORS NOV89

IV. CONCLUSIONS

Since QUEST 3.0 is a continuation of an established program, was designed with significant participation of experts, and has passed statistical tests of validity, it is concluded that:

- o QUEST 3.0 is implementable. It requires use of existing data only and has been run in a laboratory environment at DLA-DORO.
- o QUEST 3.0 is valid. Its results match the perception of experts in the field.
- o QUEST 3.0 adequately measures the QA effectiveness of DCMC contractors.

V. RECOMMENDATION. It is recommended that QUEST 3.0 be implemented throughout DCMC. It is also recommended that a feasibility study be conducted after IQUE is fully implemented to assess measures of in-house QA effectiveness or program effectiveness.

VI. BENEFITS

The incremental benefits of QUEST 3.0 from version 2.0 are based on the following logic. QUEST 3.0 has been selected as one of ten primary workload indicators in the proposed QA Resource Model currently under development. It is conservatively estimated that the use of this tool to justify and allocate quality resources could achieve comparable effectiveness with 1 percent fewer resources. Assuming that there are 7,000 QA specialists with an average grade of GS-10, step 5 with 29.55 percent fringe benefits, QUEST 3.0 benefits are:

$$\frac{1}{10} \times 1\% \times 7,000 \times \$32,098/\text{year} \times 1.2955 \\ \$291,080 \text{ per year}$$

In addition to these quantifiable benefits, QUEST 3.0 provides a more accurate measure of the contractor QA program. This information will be valuable to first line supervisors and upper management to evaluate the in-house IQUE program, to determine when and where remedial action is needed and to warn other acquisition elements where the IQUE program is not working. By measuring effectiveness based on the seven negative indicators (paragraph II.B.1-7), the QAR and the contractor will take actions to reduce the incidence of these negative indicators, leading to higher quality products and improved customer satisfaction.

VII. IMPLEMENTATION

An implementation plan was developed and approved by the SAG. It was proposed that DLA-DORO maintain the FORTRAN source code with the Job Control Language maintained by the DLA Systems Automation Center (DSAC). DSAC is responsible for exporting release 3.0 to the various field activities. Prior to release, the model will undergo environmental testing on actual field data at one site.

In September 1990, QUEST 3.0 was tested in a production environment on DCMC-West data. All aspects of the model were acceptable except the DMINS process. This part of the model must be installed by the Systems Branch, Program and Systems Management Division, Directorate of Quality Assurance (DLA-QRS) on-site and will be done in conjunction with site visits on other programs to conserve travel funds.

C      MODIFIED BY TLB ON 10/20/87                  01580004
C
C      INPUT: MATERIAL DEFICIENCY REPORT (MDR) FILES FROM FIVE DCASRS 01590004
C      OUTPUT: LISTINGS OF NUMBER OF MDRS BY MANUFACTURERS BY MONTH 01600004
C
C ****
C      DOCUMENTATION SECTION                      01610004
C ****
C
C      THE PURPOSE OF THIS PROGRAM IS TO CREATE AN INPUT FILE FOR 01620004
C          ADDITIONAL PROCESSING. THE END RESULT OF THE           01630004
C          PROGRAM IS A LISTING WHICH SHOWS HOW MANY MATERIAL       01640004
C          DEFICIENCY REPORTS (MDR) ARE RECEIVED BY THE DCASR    01650004
C          FOR A GIVEN MANUFACTURER IN A GIVEN MONTH. THE LENGTH   01660004
C          OF TIME BETWEEN THE FISCAL YEAR OF THE CONTRACT AND THE 01670004
C          DATE THE MDR WAS RECEIVED IS TAKEN INTO CONSIDERATION. 01680004
C          WITH THE SHORTER TIME CARRYING THE GREATER WEIGHT.     01690004
C          IN ADDITION, THE NUMBER OF DAYS TAKEN TO CLOSE THE MDR 01700004
C          ARE LISTED.                                         01710004
C
C      THE LOGIC OF THE MAIN PROGRAM IS AS FOLLOWS:          01720004
C
C      FIRST, IN THE SUBROUTINE CALLED "REVIEW", THE RAW DATA IS READ 01730004
C          FROM FILE ONE, SCREENED FOR ERRONEOUS DATA FIELDS        01740004
C          AND THEN REWRITTEN TO FILE TWO.                         01750004
C
C      SECOND, IN "READER", FILE TWO IS READ INTO AN ARRAY.      01760004
C
C      THIRD, IN "JDATE", THE LAST THREE DIGITS OF THE JULIAN DATE 01770004
C          OF THE DATE MDR WAS RECEIVED IS CONVERTED INTO MONTHS   01780004
C          ONE THROUGH TWELVE.                                    01790004
C
C      FOURTH, IN "SORTER", THE MDRS ARE SORTED ACCORDING TO FSCM 01800004
C          AND THE YEAR AND MONTH THE MDRS WERE RECEIVED.        01810004
C
C      FIFTH, IN "WEIGHT", THE TIME BETWEEN THE FISCAL YEAR OF THE 01820004
C          CONTRACT AND THE DATE THE MDR WAS RECEIVED IS          01830004
C          COMPUTED TO REPRESENT THE AGE OF THE MDR. THE AGE        01840004
C          IS USED TO WEIGHT THE MDR (SEE VARIABLE DICTIONARY FOR 01850004
C          WEIGHTS USED)                                         01860004
C
C      SIXTH, IN "WRITER", THE FSCM, MONTH AND YEAR THE MDR WAS RECEIVED, 01870004
C          THE WEIGHTED AVERAGE OF NUMBERS OF MDRS AND THE NUMBER OF 01880004
C          DAYS REQUIRED TO CLOSE THE MDR ARE WRITTEN TO FILE THREE. 01890004

C THIS MODULE MERGES THE FACILITY PROFILE, THE HISTORY FILE AND      00010033
C THE MDR FILE BY FSCM TO PRODUCE A MASTER DATA FILE FOR THE MODEL. 00020033
C
C THIS IS A FILE MERGER USED FOR QUEST III.MEMBER FOR(MATCH7)          00030033
C THIS IS THE PRODUCTION VERSION TO BE USED WITH THE NEW QAMIS.        00040051
C SPECIAL PROCESSES ARE PICKED UP ON FACILITY PROFILE.                 00041052
C ALSO, GOVT VERIFICATION CODE IS PICKED UP TO IDENTIFY IQUE FACILITIES. 00050048
C
C DECLARE AND ARRAY VARIABLES                                         00051049
C ARRAYS ARE DIMENSIONED TO ACCEPT NO MORE THAN TEN YEARS OF DATA    00052049
C
C A AND AA AND AAA ARE FSCM OR CAGE                                00060033
C B AND BB ARE YEAR                                                 00070033
C C AND CC ARE MONTH                                              00080033

13. ABSTRACT (Maximum 200 words) <p>This report documents the logic, structure and code for QUEST Release 3.0. QUEST Release 3.0 measures the effectiveness of the contractor's QA operations by comparing the contractor's key indicators with those of similar contractors (or peers). Based on those peer comparisons and trends, an effectiveness score for each indicator is computed and a weighted average of all indicators produces a bottom line effectiveness rating. Release 3.0 was validated by incorporating the profound knowledge of experts in the weighting factors and program logic. A study advisory group, consisting of field and Headquarters DLA QA personnel guided the effort. A statistical test was passed which compared QUEST Release 3.0 results with expert opinion on certain contractors. Because of the track record of earlier releases, the use of knowledgeable experts in the development process and the results of validity tests, it is concluded that QUEST 3.0 is implementable, valid and meets the objective of measuring contractor QA effectiveness. It is recommended that Release 3.0 be implemented throughout the Defense Contract Management Command (DCMC).</p>
